

THETA TECHNOLOGIES
GAME CHANGING NDT

Nonlinear Resonance NDT for rapid pass-fail analysis

Julian Wright
Chief Technology Officer
Theta Technologies Limited

About Theta

- USP is Non-Linear Acoustic (NLA) NDT
- Based in Exeter, UK
- Only known commercial provider of NLA in the world
- Clients in aerospace, marine and nuclear sectors, European Space Agency

About Non-Linear Acoustics

- Reveals flaws invisible to alternative methods
- Sub-surface detection
- Metals and composites
- Uses ultrasound and sound in an unconventional way

THETA TECHNOLOGIES
GAME CHANGING NDT

How does our technology work?

Transmit: **LINEAR**

Receive: **NON-LINEAR**

- Crack vibrates asymmetrically, creating non-linearity

Capability

Application

Scanning or Triaging

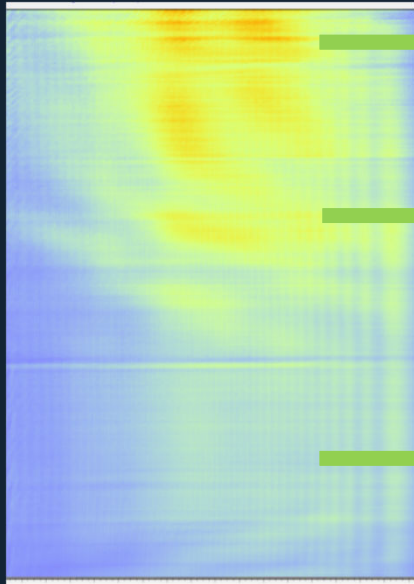

Applications (Scanning)

- Robot scanning Friction Stir Weld to find micro-defects

Applications

'Heat-map' of non-linearity

Samples cut for microscopy

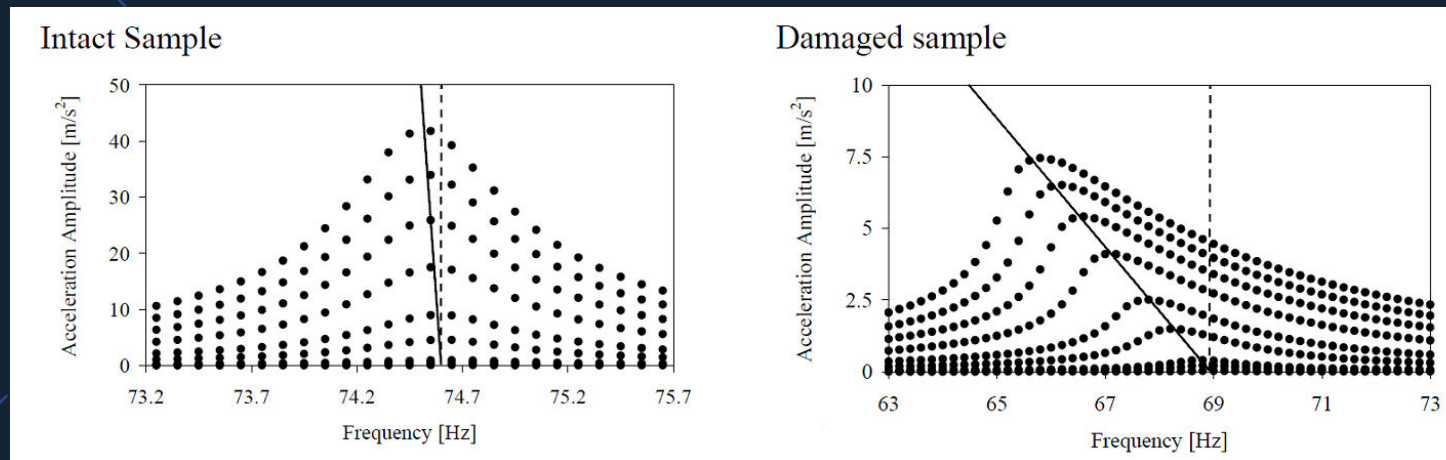

Capability:

1-2µm x 100-200µm

Applications (Triage)

- Nonlinear Resonance – rapid pass/fail

In an intact resonant system, the resonance frequency reduces very slightly with increase in excitation amplitude. If the system contains compliant defects (such as a crack), the resonance frequency reduces much more markedly with increasing strain. By comparing the relative shifts in resonance, the integrity of a testpiece may be assessed.

Applications (Triage)

NLR system in RASCAL demonstrator at MTC

Data for JG59 AM NDT draft standard: X-ray CT and Nonlinear Resonance on Nacelle hinges ND1 and ND2

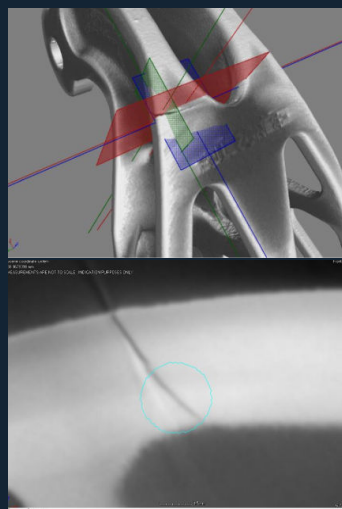

X-ray CT

X-Ray CT of sample ND1 :
(Voxel size 121 μm):

Planned without
defects

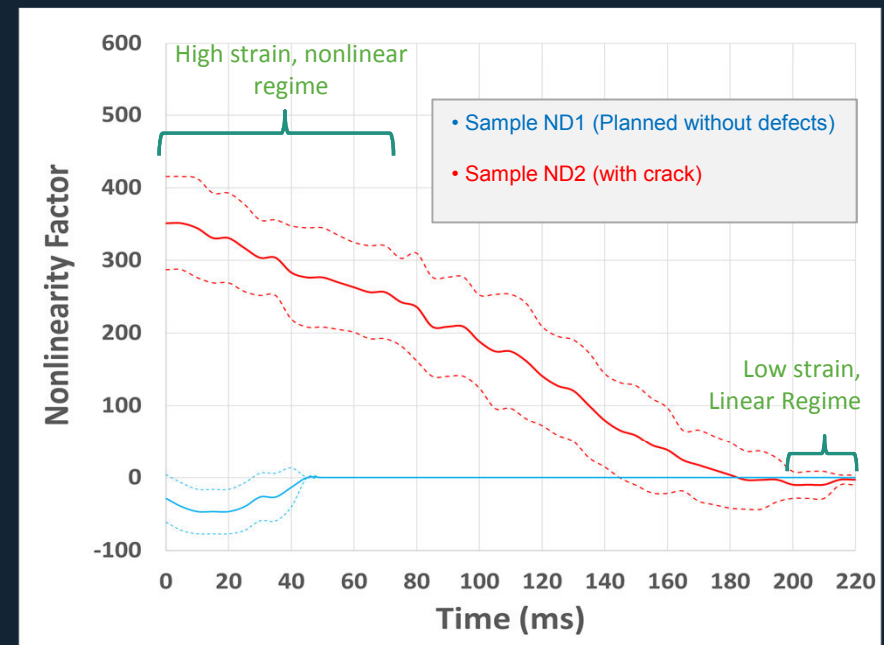

X-ray CT of sample ND2
(Voxel size 121 μm):

Process crack on one of
its arms

Test time: Several hours per sample

Nonlinear Resonance

Nonlinear Resonance drift on sample ND1 (planned without defects) compared to sample ND2 (with a process crack) showing clear differentiation.

Test time: <1 minute per shot
